Introduction

This project provides an analysis of a web application designed to offer users a comprehensive platform for accessing diverse movie information.
The project aims to develop a user-friendly interface that enables individuals to explore and discover details about a wide range of films.

Movies

The Movie function allows users to search for a specific movie and, as a result, retrieve information about the movie, such as the year of release, genre, the actors who have participated in the movie, and a brief overview of the movie.

Rating

The Rating function is specifically designed to facilitate users in sorting movies based on their respective ratings.

Genre

The Genre function is implemented as a dropdown menu to provide users with an overview of the various movie genres available for selection. This feature enables users to choose from a range of genres to refine their movie search and explore specific genres of interest.
